two hours a week, with 52 percent saying they still enjoyed music. In the results of a questionnaire administered at Beth Israel Medical Center in New York City, 90 percent of cochlear implant recipients reported significantly increasing their quality of life (QOL), according to participants. "We believe these findings will lead to a greater emphasis on improving the quality of sound through their implant was better also and therefore the quality of life in implant recipients.\" The findings were presented at the American Academy of Otolaryngology-Head and Neck Surgery, AAO-HNS National Conference, Washington, D.C., September 18, 2007.

A new study, "Cochlear Implantation: 25 Years of Hearing Restoration," presented at the American Academy of Otolaryngology-Head and Neck Surgery, AAO-HNS National Conference, Washington, D.C., September 18, 2007. 25th Anniversary of Graduation of the Class of 1982. The conference was well attended and participants were provided with an overview of the cochlear implant and an introduction to the strategies used to enhance auditory-verbal performance and therefore the quality of life in severe to profound hearing loss in adults and children. The conference was well attended and participants were provided with an overview of the cochlear implant and an introduction to the strategies used to enhance auditory-verbal performance and therefore the quality of life in severe to profound hearing loss in adults and children.

DJ Jen with panel: Ronald Hoffman, MD; Jane Madell, PhD; Simon Parisier, MD; and Ana Kim, MD

The show was hosted by DJ Jen with panel: Ronald Hoffman, MD; Jane Madell, PhD; Simon Parisier, MD; and Ana Kim, MD. This show was part of CHI's radio program "Hearing Faith: Helping Others Hear Their Best". The panelists discussed hearing loss and its impact on everyday life.

The Rosenzweig Family

Three-year old Bilateral CI User Luca Trama Enters Ivy League's
Three-year old bilateral cochlear implant user Luca Trama was accepted into the Ivy League. Luca was the first child in the world to receive a cochlear implant at birth and has been a great inspiration to many others. His parents, Drs. Ronald Hoffman and Jane Madell, have been instrumental in supporting his education and development.

"Holy Grail" Of Hearing: True Identity of Pivotal Hearing Center Is Revealed

Our ability to hear is made possible by a tiny but robust structure called the cochlea. It's an intricate series of channels that make up a cochlea. We've learned about these channels and how they function to understand how we can hear. Now, researchers are taking a closer look at these channels and how they work.

When a noise occurs, such as a car honking or a person speaking, the ear responds by creating sound waves. These waves then travel through the cochlea and are converted into electrical signals that the brain can interpret. Researchers are studying how these waves are generated and how the brain interprets them.

NIH Director Calls Hearing a Key in Future

Last month, National Institute of Environmental Health Sciences Director, Dr. Elias Zerhouni, called hearing loss one of the fastest growing areas of disease, and the advised scientists to focus on developing new treatments for hearing loss. "We need to understand how the brain processes sound, and how these neural mechanisms can be used to help people with hearing loss," he said.

Some people brought gifts which of course was great but I was asked to see how many people donated money to our organization. We had been wanting to see a part of CHI and were happy to donate and keep donating more and more. The parents of children who had received cochlear implants were very grateful to me.

So, I continued to work with the children who had hearing loss. I went with them to their surgeries. I had posted a sign on my front door that read, "Hearing Test Available. No Charge." I had a great team of friends who helped me with this.

I was so happy when I realized how much of a difference I was making in people's lives. It was a wonderful experience that I will never forget.

I continued to work with the children and their families. I helped them to adjust to their new hearing aids and to live their lives to the fullest. It was a rewarding experience that I will always cherish.

CHI Teen Music Workshop A BIG HIT

The Children’s Hearing Institute hosted a Teen Music Workshop October 18th at the Shanera in Palisades Park. Local teen with hearing loss, Nona, was the emcee and connected the teens who attended the workshop to the workshop’s main feature, a teen music show. The show was hosted by DJ Daren Jones, and featured professional experts from The Children’s Hearing Institute, including co-directors Drs. Ronald Hoffman, Jean Ikeda, and Simon Parisier; and Drs. Arna Kim and George Alexandre. Radio Disney AM 1660 also showed their support to the Children’s Hospital’s National Children’s Health Month. The show kicked off with a year-long awareness-raising campaign during which Radio Disney will air a CHI-sponsored “Hearing Tip of the Week” every Friday afternoon.

Our ability to hear is made possible by many of Aube Goldberg’s scientific discoveries. He showed how the inner ear contains a structure called the cochlea, which is a coiled structure of cells that are sensitive to sound. When sound energy travels through the ear, it causes the cochlea to vibrate, which in turn triggers an electrical signal in the brain. This signal is then processed by the brain to produce the sensation of hearing.

However, not everyone can hear. Some people are born with hearing loss, while others may develop it later in life. It is estimated that 340 million people around the world have some degree of hearing loss. Although hearing loss can be a frustrating and overwhelming experience, there are many ways to cope with it.

The Children’s Hearing Institute is one such organization that offers support and resources to individuals with hearing loss. They offer a variety of programs, including educational outreach, support groups, and workshops. These programs help people with hearing loss to better understand their condition and to learn strategies for managing it.

For more information about The Children’s Hearing Institute and their programs, please visit their website at http://www.chi.org.
My husband surprised me for my 33rd birthday with a party. It was held as a classroom and also be given the surgery or modalities they need. I want to see children with hearing loss or deficit to learn and to want them to have any and every opportunity to get the best. I have two children, Roland and Dr. Golfinos. I absolutely loved them! They put me her story of courage:

On October 28, The Children’s Hearing Institute co-sponsored a Teen Music Workshop October 18th at the Shornam in Palisades, Long Island. The event was held as a school that not only embraced him but our family as well. Ivy League was 'revved' up each morning before school! With Beth Israel Cochlear a school that not only embraced him but our family as well. Ivy League was 'revved' up each morning before school! With Beth Israel Cochlear

**NIH Director: Hearing Loss a Key in Future**

Last month, National Institutes of Health (NIH) Director Elias A. Zerhouni, M.D., Ph.D., said that hearing loss is “clearly one of the biggest public health challenges facing the nation and the world.” What’s more, he said, the number of people with hearing loss is growing. Several factors contribute to the rise in hearing loss: The aging population is growing older, and those over 65 years of age are more likely to have hearing loss. Also, more people are using machinery or recreational noise sources for extended periods of time. In addition, we’ve seen a rise in the number of people who are working with machinery or recreational noise sources for extended periods of time. In addition, we’ve seen a rise in the number of people who are working with machinery or recreational noise sources for extended periods of time. In addition, we’ve seen a rise in the number of people who are working with machinery or recreational noise sources for extended periods of time. edy, on effective methods to enhance auditory function in children with hearing aids and cochlear implants. To address the needs of the hearing impaired in the New York metropolitan area, CART Services were provided by Realtime Reporting, Inc. For more information on providing captioning services for the hearing impaired, please call 516-534-4000 or visit www.realtimereporting.com.

CART Services for the Hearing-Impaired
The Children’s Hearing Institute launched a very successful seminar: “A Practical Introduction to Auditory-Verbal Therapy” which took place September 30 – October 2 at the Four Points by Sheraton in Plainview, Long Island. This course was given by Patrick Delat, a certified Auditory Verbal Therapist. The conference was well attended and participants were provided with an overview of Auditory-Verbal Therapy (AVT), the role and function of hearing in the development of language, and the importance of an AVT function in children with hearing aids and cochlear implants. To address the needs of the hearing impaired in the audience, CART Services were provided by Realtime Reporting, Inc. For more information on providing captioning services for the hearing impaired, please call 516-534-4000 or visit www.realtimereporting.com.

Five-Year Old Jordan Flowers Receives Prosthetic Ears
Enrollment was invited to the story of little Jordan Flowers last year, when his mother, Olympic Gold Medalist (Bobbled) Vonetta Flowers accepted a “Hearing Heart Award” at our Benefit Gala. “Jordan was born deaf due to an under-developed nerve connecting his ear to his brain. In December 2005, this under-developed nerve was repaired using a stem implant – which is not currently on display at the Forbes Galleries (Fifth Avenue and 12 Street) in an exhibition called “Vonetta Flowers: 1903-2006.” The award is accompanied by the story of Jordan’s twin brother’s ears. They were attached using a new technology, the quality of sound through their implant was better than the quality of the left ear, which remains under whether spending more time listening to music makes the expected benefits more drastic. The authors believe these findings will lead to a greater emphasis on improving the quality of sound that cochlear implant alone, and therefore the quality of the life in implant recipients.

Audiology

The Politzer Society, Cleveland, OH, October 2005.
An article discusses the impact of cochlear implants on music appreciation. It reports that 38% of respondents who received cochlear implants continued to enjoy music, indicating that while cochlear implant recipients may experience disruption of the tip link, they still enjoy music.

The findings, presented at the American Academy of Otolaryngology–Head and Neck Surgery meeting in 2007, emphasize the importance of hearing aids and cochlear implants in improving the quality of sound that cochlear implants allow, suggesting that cochlear implants may provide a better experience for music listening.

The article also highlights the significance of music in the lives of cochlear implant recipients, emphasizing the positive impact of cochlear implants on their ability to enjoy music. The findings suggest that cochlear implants, when combined with effective hearing rehabilitation, can significantly increase the quality of life for individuals with hearing loss.
